38                if (!sumf) return maxf;
39            }
40        }
41        return maxf - sumf;
42    }
43    LL dinic() {
44        LL ret = 0;
45        while (bfs()) ret += dfs(S, INF);
46        return ret;
47    }
48    void rebuild(){
49        //无向图采用  $e[i].f = e[i^1].f$  的方式建立图

```

```

50     for(int i = 2; i <= ecnt; i+=2) e[i].f = e[i^1].f = (e[i].f + e[i^1].f) >> 1;
51     //有向图
52     //for(int i = 2; i <= ecnt; i+=2) e[i].f += e[i^1].f, e[i^1].f = 0;
53 }
54 }

```

#### 1.2.4 Bound Flow

```

1 namespace NWF{
2     //在 Edge 中添加下限, delta_flow[i]: 节点 i 的入流-出流, bound_flow 注意要处理除了 SS 和 TT 以
    外的点
3     int delta_flow[MAXN];
4     void addEdge(int u, int v, int mxf, int mnf) {
5         addEdge(u, v, mxf-mnf);
6         delta_flow[u] -= mnf; delta_flow[v] += mnf;
7     }
8     void delEdge(int u) {
9         for(int i = head[u]; i; i = e[i].nxt) e[i].f = e[i^1].f = 0;
10    }
11    int bound_flow() {
12        int SS = ++tot, TT = ++tot, sum = 0;
13        head[SS] = head[TT] = 0;
14        for(int i = 1; i <= tot; ++i) {
15            if(delta_flow[i] < 0) addEdge(i, TT, -delta_flow[i]);
16            if(delta_flow[i] > 0) {
17                sum += delta_flow[i];
18                addEdge(SS, i, delta_flow[i]);
19            }
20        }
21        addEdge(T, S, INF);
22        int tS = S, tT = T;
23        S = SS; T = TT;
24        if (dinic() == sum) {
25            delEdge(SS); delEdge(TT);
26            int flow = e[ecnt].f;
27            e[ecnt].f = e[ecnt^1].f = 0;
28            //S = tS; T = tT; // 有上下界有源汇最大流
29            //return flow + dinic();
30            S = tT; T = tS; // 有上下界有源汇最小流
31            return flow - dinic();
32        } else {
33            return -1;
34        }
35    }
36 }

```

#### 1.2.5 Modeling Optimization

利用分治优化建模, 每个点  $i$  向  $j$  连边, 费用为  $|a_i - a_j|$

```

1 int pos[MAXN];
2 pair<int, int> tmp[MAXN];
3 void CDQ(int L, int R) {
4     if (L == R) return;
5     int mid = (L + R) >> 1;
6     CDQ(L, mid); CDQ(mid + 1, R);
7     inplace_merge(tmp + L, tmp + mid + 1, tmp + R + 1);
8     for (int i = L; i <= R; ++i) pos[tmp[i].second] = i;
9     for (int i = 2; i <= R - L + 1; ++i) {

```

```

10     addEdge(tot + i, tot + i - 1, INF, tmp[L + i - 1].first - tmp[L + i - 2].first);
11     addEdge(tot + i - 1, tot + i, INF, tmp[L + i - 1].first - tmp[L + i - 2].first);
12 }
13 for (int i = L; i <= R; ++i) {
14     if (i <= mid)
15         addEdge(i+i-1, tot + pos[i] - L + 1, 1, 0);
16     else
17         addEdge(tot + pos[i] - L + 1, i+i, 1, 0);
18 }
19 tot += R - L + 1;
20 }

```

### 1.2.6 Gomory-Hu Tree

两点间的割可以转为树上两点的距离

```

1 namespace NWF{
2     Edge Te[MAXN];
3     int Tcnt, Thead[MAXN];
4     void TaddEdge(int u, int v, LL f) {
5         Te[++Tcnt] = (Edge) {v, Thead[u], f}; Thead[u] = Tcnt;
6         Te[++Tcnt] = (Edge) {u, Thead[v], f}; Thead[v] = Tcnt;
7     }
8     int node[MAXN], tmp[MAXN];
9     void build(int l, int r) {
10         if (l == r) return;

167 }
168 };
```

## 3 String

### 3.1 Basics

#### 3.1.1 Hash

```

1  const LL p1 = 201, p2 = 301, mod1 = 1200000319, mod2 = 2147483647;
2  struct Hash {
3      LL a, b;
4      void append(Hash pre, int v) {
5          a = (pre.a * p1 + v) % mod1;
6          b = (pre.b * p2 + v) % mod2;
7      }
8      void init(string S) {
9          a = b = 0;
10         for(int i = 0; i < S.size(); i++) append(*this, S[i]);
11     }
12     bool operator == (const Hash &x) const {
13         return a == x.a && b == x.b;
14     }
15     bool operator < (const Hash &x) const {
16         return a < x.a || (a == x.a && b < x.b);
17     }
18 };

```

#### 3.1.2 Minimum String

```

1  namespace minstring{
2      int getmin(char *s, int sn) {
3          int i = 0, j = 1, k = 0, t;
4          while(i < sn && j < sn && k < sn) {
5              t = s[(i + k) % sn] - s[(j + k) % sn];
6              if(!t) k++;
7              else {
8                  if(t > 0) i += k + 1; else j += k + 1;
9                  if(i == j) j++;
10                 k = 0;
11             }
12         }
13         return i < j ? i : j;
14     }
15 }

```

### 3.2 String Matching

#### 3.2.1 Bitset Match

```

1  namespace BitMatch{
2      const int S = 26;
3      bitset<MAXN> bs[S], ret;
4      char s[MAXN];
5      inline int idx(char c) { return c - 'a'; }
6      inline void init() {
7          for(int i = 0; i < 26; i++) bs[i].reset();
8          scanf("%s", s);
9          int sn = strlen(s);

```

```

10     for(int i = 0; i < sn; i++) bs[idx(s[i])].set(i);
11 }
12 void modify(int p, char ch) {
13     bs[idx(s[p])].reset(p);
14     s[p] = ch;
15     bs[idx(s[p])].set(p);
16 }
17 int match(char *t, int tn) { //返回 t 串在 s 串中出现的次数
18     ret = bs[idx(t[0])];
19     for(int i = 1; i < tn; i++) {
20         ret <<= 1;
21         ret &= bs[idx(t[i])];
22     }
23     return ret.count();
24 }
25 }

```

### 3.2.2 KMP && exKMP

```

1 判断循环子串的充要条件:  $i/(i-fa[i]) > 1$  &&  $i\%(i-fa[i])==0$  (i是长度)且去除下面fa的优化
2 namespace KMP {
3     int fa[MAXN];
4     void get_fail(char* t, int tn) {
5         fa[0] = -1;
6         int i = 0, j = -1;
7         while(i < tn) {
8             if (j == -1 || t[i] == t[j]) {
9                 ++i; ++j;
10                fa[i] = t[i] != t[j] ? j : fa[j];
11            }else{
12                j = fa[j];
13            }
14        }
15    }
16    void kmp(char* s, int sn, char* t, int tn) {
17        int i = 0, j = 0;
18        while(i < sn) {
19            if (j == -1 || s[i] == t[j]) {
20                i++;j++;
21                if(j == tn) {
22                }
23            }else j = fa[j];
24        }
25    }
26 }
27 nxt[i]是t和从i开始的t的后缀的最大公共前缀长度。
28 t,s的第一个字符下标为0, 最后一个字符下标为n-1。
29 namespace exKMP {
30     int nxt[MAXN], ext[MAXN];
31     void get_nxt(char* t, int tn) {
32         int j = 0, mx = 0;
33         nxt[0] = tn;
34         for(int i = 1; i < tn; i++) {
35             if(i >= mx || i + nxt[i - j] >= mx) {
36                 if(i > mx) mx = i;
37                 while(mx < tn && t[mx] == t[mx - i]) mx++;
38                 nxt[i] = mx - i;
39                 j = i;
40             }else nxt[i] = nxt[i - j];
41         }

```

```

42     }
43     void exkmp(char *s, int sn, char *t, int tn) {
44         int j = 0, mx = 0;
45         for(int i = 0; i < sn; i++) {
46             if(i >= mx || i + nxt[i - j] >= mx) {
47                 if(i > mx) mx = i;
48                 while(mx < sn && mx - i < tn && s[mx] == t[mx - i]) mx++;
49                 ext[i] = mx - i;
50                 j = i;
51             }else ext[i] = nxt[i - j];
52         }
53     }
54 }

```

### 3.2.3 AC Automaton

```

1  namespace AC {
2      int ch[MAXN][sigma_size], last[MAXN];
3      int val[MAXN], f[MAXN], sz;
4      inline void init() { sz = 1; memset(ch[0], 0, sizeof(ch[0])); }

22            }
23        }
24    }
25 }

```

### 3.4.2 Palindromic Automaton

pcnt 本质不同的回文串的个数 len[u] 状态 u 代表的串的长度 fail[u] 状态 u 所代表的回文串的最长回文后缀 trans[u] 小于等于当前节点长度一半的最长回文后缀 cnt[u] 包含状态 u 表示的回文串的出现的个数 (调用 count()) num[u] 以状态 u 表示的回文串的右端点为回文串结尾的回文串个数 [..[....]] diff[u] 表示节点 u 和 fail[u] 所代表的回文串的长度差, 即 len[u] - len[fail[u]] slink[u] 表示 u 一直沿着 fail 向上跳到第一个节点 v, 使得 diff[v] != diff[u], 也就是 u 所在等差数列中长度最小的那个节点

```

1 namespace PAM {
2     int scnt, S[MAXN];

```

```

3  int pcnt, last, len[MAXN], fail[MAXN], ch[MAXN][26];
4  int cnt[MAXN], num[MAXN], trans[MAXN], diff[MAXN], slink[MAXN];
5  int newnode(int _len) {
6      len[pcnt] = _len;
7      cnt[pcnt] = num[pcnt] = 0;
8      for(int i = 0; i < 26; i++) ch[pcnt][i] = 0;
9      return pcnt++;
10 }
11 inline void init() {
12     S[scnt = 0] = -1;
13     pcnt = 0; newnode(0); newnode(-1);
14     fail[0] = 1; last = 0;
15 }
16 int getfail(int x) {
17     while(S[scnt - len[x] - 1] != S[scnt]) x = fail[x];
18     return x;
19 }
20 void extend(int c) {
21     S[++scnt] = c;
22     int cur = getfail(last);
23     if(!ch[cur][c]) {
24         int now = newnode(len[cur] + 2);
25         fail[now] = ch[getfail(fail[cur])][c];
26         ch[cur][c] = now;
27         num[now] = num[fail[now]] + 1;
28         if (len[now] <= 2) trans[now] = fail[now];
29         else{
30             int x = trans[cur];
31             while(S[scnt - len[x] - 1] != S[scnt] || (len[x]+2) * 2 > len[now]) x =
fail[x];
32             trans[now] = ch[x][c];
33         }
34         diff[now] = len[now] - len[fail[now]];
35         slink[now] = (diff[now] == diff[fail[now]]) ? slink[fail[now]] : fail[now];
36     }
37     last = ch[cur][c];
38     cnt[last]++;
39 }
40 void count() {
41     for(int i = pcnt - 1; i >= 0; i--) cnt[fail[i]] += cnt[i];
42 }
43 };

```

支持前后插入不基于势能分析的构造法可以实现持久化，比如在 Trie 上实现

```

1  namespace PAM {
2      int sL, sR, S[MAXN<<1];
3      int pcnt, lastL, lastR;
4      int len[MAXN<<1], fa[MAXN<<1], quick[MAXN<<1][26], ch[MAXN<<1][26];
5      int cnt[MAXN<<1], num[MAXN<<1];
6      int newnode(int _len) {

```

#### 4.2.9 Min\_25 Sieve

思路为把结果分为  $i$  为质数的和,  $i$  为合数的和,  $i=1$  的和

$g(n, j)$  表示从 1 累加到  $n$  的  $f(i)$ , 其中的  $i$  满足要么  $i$  自己是质数, 要么  $i$  的最小质因子大于第  $j$  个质数

要求  $f(p)$  ( $p$  is prime) 可被多项式表示,  $f(p^k)$  可快速计算

分别计算多项式  $x^0, x^1, x^2$  的  $g(n, j)$  和  $h(n, j)$

$h$  由欧拉筛计算, 递归起点  $g(n, 0)$

公式

$$\sum_i^n f(i)$$

$$g(n, j) = \begin{cases} g(n, j-1) & p_j^2 > n \\ g(n, j-1) - f(p_j)[g(\frac{n}{p_j}, j-1) - g(p_j-1, j-1)] & p_j^2 \leq n \end{cases}$$

其中

$$g(p_j-1, j-1) = \sum_i^{j-1} f(p_i)$$

可用 h 表示

$S(n, j)$  表示从 1 累加到  $n$  的  $f(i)$ ，同样的， $i$  满足要么  $i$  自己是质数，要么  $i$  的最小质因子大于第  $j$  个质数和  $g$  顺序相反，最后答案为  $S(n, 1)$ ，递推式为

$$S(n, j) = g(n, |P|) - \sum_{i=1}^j f(p_i) + \sum_{k \geq j} \sum_{p_k^{e+1} < n} (f(p_k^e) S(\frac{n}{p_k^e}, k+1) + f(p_k^{e+1}))$$

前一部分  $g(n, |P|) - \sum_{i=1}^j f(p_i)$  是相应的质数部分和。

例题：欧拉函数前缀和

$$\sum_{i=1}^n \varphi(i)$$

$g_{k,n}$  and  $h_{k,n}$  Count

$$\sum_{i=1}^n i^k$$

## 6 Conclusion

### 6.1 Math

#### 6.1.1 Euler's Theorem

$$a^b \equiv \begin{cases} a^{b \% \varphi(p)} & \gcd(a, p) = 1 \\ a^b & \gcd(a, p) \neq 1, b < \varphi(p) \\ a^{b \% \varphi(p) + \varphi(p)} & \gcd(a, p) \neq 1, b \geq \varphi(p) \end{cases} \pmod{p}$$

#### 6.1.2 Möbius Inversion

Dirichlet Convolution is  $(f \times g)(N) = \sum_{d|N} f(d) * g(\frac{N}{d})$

Theorem:

$$\begin{cases} f = g \times 1 \\ g = f \times \mu \end{cases}$$

$$\begin{cases} id(n) = \sum_{d|n} \varphi(d) \\ e(n) = \sum_{d|n} \mu(d) \end{cases} \quad (1)$$

$$\begin{cases} \sum_i^n \sum_j^m gcd(i, j) = \sum_d^{\max(n, m)} \varphi(d) * \lfloor \frac{n}{d} \rfloor \lfloor \frac{m}{d} \rfloor \\ \sum_i^n \sum_j^m e(gcd(i, j)) = \sum_d^{\min(n, m)} \mu(d) * \lfloor \frac{n}{d} \rfloor \lfloor \frac{m}{d} \rfloor \\ \sum_{i=1}^n |\mu(i)| = \sum_{i=1}^{\lfloor \sqrt{n} \rfloor} \mu(i) * \lfloor \frac{n}{i * i} \rfloor \end{cases} \quad (2)$$

$$\begin{cases} sum(x, y) = \sum_i^x \sum_j^y i * j = \frac{x * (x+1)}{2} * \frac{y * (y+1)}{2} \\ F(x, y) = \sum_{i=1}^{\min(x, y)} i^2 * \mu(i) * sum(\lfloor \frac{x}{i} \rfloor, \lfloor \frac{y}{i} \rfloor) \\ \sum_i^n \sum_j^m lcm(i, j) = \sum_{i=1}^{\min(n, m)} d * F(\lfloor \frac{n}{i} \rfloor, \lfloor \frac{y}{i} \rfloor) \end{cases} \quad (3)$$

#### 6.1.3 Sieve Tips

$$\varphi(nm) = \varphi(n) \cdot \varphi(m) \cdot \frac{gcd(n, m)}{\varphi(gcd(n, m))} \quad (4)$$

$$\varphi(n) = \sum_{i=1}^n [(n, i) = 1] \cdot i = \frac{n * \varphi(n) + [n = 1]}{2} \quad (5)$$

$$\left\{ \begin{array}{l} id = \varphi \times 1 \\ \frac{n \cdot (n+1)}{2} = \sum_{i=1}^n i = \sum_{i=1}^n \sum_{d|i} \varphi(d) = \sum_{\frac{i}{d}=1}^n \sum_{d=1}^{\lfloor \frac{n}{d} \rfloor} \varphi(d) = \sum_{i=1}^n \phi(\lfloor \frac{n}{i} \rfloor) \end{array} \right. \quad (6)$$

$$\left\{ \begin{array}{l} e = \mu \times 1 \\ 1 = \sum_{i=1}^n [i=1] = \sum_{i=1}^n \sum_{d|i} \mu(d) = \sum_{i=1}^n \sum_{d=1}^{\lfloor \frac{n}{d} \rfloor} \mu(d) = \sum_{i=1}^n M(\lfloor \frac{n}{i} \rfloor) \end{array} \right. \quad (7)$$

$$\left\{ \begin{array}{l} id^2 = (id \cdot \varphi) \times id \\ \phi'(n) = \sum_{i=1}^n i \cdot \varphi(i) \\ \frac{n \cdot (n+1) \cdot (2n+1)}{6} = \sum_{i=1}^n i^2 = \sum_{i=1}^n \sum_{d|i} d \cdot \varphi(d) \cdot \frac{i}{d} = \sum_{\frac{i}{d}=1}^n \sum_{d=1}^{\lfloor \frac{n}{d} \rfloor} d \cdot \varphi(d) = \sum_{i=1}^n i \cdot \phi'(\lfloor \frac{n}{i} \rfloor) \end{array} \right. \quad (8)$$

#### 6.1.4 Newton's method

Iff

$$f'(x) \neq 0 \ \&\& \ f''(x) \text{continuous}$$

Then

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$$

#### 6.1.5 Cantor Expansion

康托展开是一个全排列到一个自然数的双射，常用于构建哈希表时的空间压缩。康托展开的实质是计算当前排列在所有由小到大全排列中的顺序，因此是可逆的。以下称第  $x$  个全排列是都是指由小到大的顺序。

$$X = a_n(n-1)! + a_{n-1}(n-2)! + \cdots + a_1 \cdot 0!$$

其中  $a_i$  为排列的第  $i$  个元素值

例如，3 5 7 4 1 2 9 6 8 展开为 98884。因为  $X=2*8!+3*7!+4*6!+2*5!+0*4!+0*3!+2*2!+0*1!+0*0!=98884$ 。

解释：

排列的第一位是 3，比 3 小的数有两个，以这样的数开始的排列有 8! 个，因此第一项为  $2*8!$

排列的第二位是 5，比 5 小的数有 1、2、3、4，由于 3 已经出现，因此共有 3 个比 5 小的数，这样的排列有 7! 个，因此第二项为  $3*7!$

以此类推，直至  $0*0!$

用途：

显然， $n$  位（ $0 \sim n-1$ ）全排列后，其康托展开唯一且最大约为  $n!$ ，因此可以由更小的空间来储存这些排列。由公式可将  $X$  逆推出唯一的一个排列。

逆运算：

如  $n=5, x=96$  时：

首先用  $96-1$  得到 95，说明  $x$  之前有 95 个排列。（将此数本身减去 1）

用 95 去除 4! 得到 3 余 23，说明有 3 个数比第 1 位小，所以第一位是 4。

用 23 去除 3! 得到 3 余 5，说明有 3 个数比第 2 位小，所以是 4，但是 4 已出现过，因此是 5。

用 5 去除  $2!$  得到 2 余 1, 类似地, 这一位是 3.

用 1 去除  $1!$  得到 1 余 0, 这一位是 2.

最后一位只能是 1.

所以这个数是 45321.

按以上方法可以得出通用的算法。

### 6.1.6 $\sum_{i=1}^n i^k$

$$\begin{aligned}\sum_i^n i &= \frac{n(n+1)}{2} \\ \sum_i^n i^2 &= \frac{n(n+1)(2n+1)}{6} \\ \sum_i^n i^3 &= \left[\frac{n(n+1)}{2}\right]^2\end{aligned}$$

### 差分和组合数: $O(k^2)$

考虑数列  $\{1_k, 2_k, \dots, i_k\}$

相邻两项做差之后, 得到的数列的每项应该是一个  $k-1$  次关于  $i$  的多项式。

再次相邻两项做差之后, 得到的数列的每项应该是一个  $k-2$  次关于  $i$  的多项式。

如此进行  $k$  次, 得到的数列的每项应该是一个 0 次关于  $i$  的多项式, 即常数数列。

再次相邻两项做差之后, 一定会得到一个全是 0 的数列。

假设经过  $i$  次差分数列之后的数列第一项为  $r_i$  那么答案就是

$$\sum_{i=0}^k r_i \binom{n}{i+1}$$

举例来说, 考虑数列

1, 8, 27, 64, 125, 216, ...

求差分可得

7, 19, 37, 61, 91, ...

12, 18, 24, 30, ...

6, 6, 6, ...

0, 0, ...

每个数列的第一项为 1, 7, 12, 6。所以最终的答案即为

$$\binom{n}{1} + 7\binom{n}{2} + 12\binom{n}{3} + 6\binom{n}{4} = \frac{n^2(n+1)^2}{4}$$

### 拉格朗日插值: $O(k)$

### 6.1.7 Generating Function

## 生成函数

### 普通型

$$A(x) = \sum_{i=0}^{\infty} a_i x^i$$

已知  $\{a_i\}$ ,  $\{b_i\}$  的生成函数分别是  $A(x)$ ,  $B(x)$ 。

那么  $\{a_i \pm b_i\}$  的生成函数是  $A(x) \pm B(x)$ 。

值得注意的是数列  $\{a_i\}$ ,  $\{b_i\}$  的卷积的生成函数, 恰好是  $C(x) = A(x)B(x)$ 。

$$c_i = \sum_j a_j b_{i-j}$$

## 关键公式

$$\frac{1}{1-x} = 1 + x + x^2 + x^3 + \cdots = \sum_i x^i$$

$$\frac{1}{1-x^2} = 1 + x^2 + x^4 + x^6 + \cdots = \sum_i x^{2i}$$

推广的二项式定理

$$(1+x)^n = \binom{n}{0}x^0 + \binom{n}{1}x^1 + \binom{n}{2}x^2 + \cdots = \sum_i \binom{n}{i}x^i$$

其中有  $\beta$  函数和  $\Gamma$  函数

$$\Gamma(s) = \int_0^{+\infty} x^{s-1} e^{-x} dx$$

$$B(p, q) = \binom{p+q}{p} = \int_0^1 x^{p-1} (1-x)^{q-1} dx = \frac{\Gamma(p)\Gamma(q)}{\Gamma(p+q)}$$

分别有递推公式

$$\Gamma(s+1) = s\Gamma(s)$$

$$B(p, q) = B(q, p)$$

$$= \frac{q-1}{p+q-1} B(p, q-1)$$

$$= \frac{p-1}{p+q-1} B(p-1, q)$$

$$= \frac{(p-1)(q-1)}{(p+q-1)(p+q-2)} B(p-1, q-1)$$

## 例子

### Fibonacci 生成函数

构造一个与  $f_n$  有关得幂级数

$$F(x) = f_0 + f_1 x + f_2 x^2 + \cdots + f_n x^n + \cdots$$

亦即

$$F(x) = xF(x) + x^2 F(x) + f_0 + (f_1 - f_0)x$$

带入  $f_0 = 0, f_1 = 1$

$$F(x) = \frac{x}{1-x-x^2}$$

如果想继续计算通项，我们需要解方程得到

$$\frac{x}{1-x-x^2} = \frac{a}{1-\alpha x} + \frac{b}{1-\beta x}$$

解出

$$\begin{cases} \alpha = \frac{1+\sqrt{5}}{2} \\ \beta = \frac{1-\sqrt{5}}{2} \end{cases}$$

带入方程有

$$a = \frac{1}{\sqrt{5}}, b = -\frac{1}{\sqrt{5}}$$

则

$$\begin{aligned} F(x) &= \frac{a}{1-\alpha x} + \frac{b}{1-\beta x} \\ &= a(1 + \alpha x + \alpha^2 x^2 + \cdots) + b(1 + \beta x + \beta^2 x^2 + \cdots) \end{aligned}$$

蕴含通项为

$$f_n = a\alpha^n + b\beta^n = \frac{\left(\frac{1+\sqrt{5}}{2}\right)^n - \left(\frac{1-\sqrt{5}}{2}\right)^n}{\sqrt{5}}$$

## Catalan 数

$$c_n = \sum_{i=1}^{n-1} c_i c_{n-i}$$

生成函数

$$C(x) = c_1 x + c_2 x^2 + \cdots$$

亦即

$$C(x) = xC(x)^2 + 1$$

解得

$$C(x) = \frac{1 - \sqrt{1-4x}}{2x}$$

利用推广的二项式定理展开  $\sqrt{1-4x}$  可得通项

$$c_n = \frac{1}{n} \binom{2n-2}{n-1}$$

## 指数型生成函数

$$A(x) = \sum_{i=0}^{\infty} \frac{a_i x^i}{i!}$$

已知  $\{a_i\}$ ,  $\{b_i\}$  的生成函数分别是  $A(x)$ ,  $B(x)$ 。

那么  $\{a_i \pm b_i\}$  的生成函数是  $A(x) \pm B(x)$ 。

值得注意的是数列  $\{a_i\}$ ,  $\{b_i\}$  的卷积的生成函数，恰好是  $C(x) = A(x)B(x)$ 。

$$c_i = \sum_j \binom{i}{j} a_j b_{i-j}$$

关键公式

$$\begin{aligned} e^x &= 1 + x + \frac{1}{2}x^2 + \frac{1}{6}x^3 + \cdots = \sum_i \frac{x^i}{i!} \\ e^{-x} &= 1 - x + \frac{1}{2}x^2 - \frac{1}{6}x^3 + \cdots = \sum_i \frac{(-x)^i}{i!} \\ \frac{e^x + e^{-x}}{2} &= 1 + \frac{1}{2}x^2 + \frac{1}{24}x^4 + \cdots = \sum_i \frac{x^{2i}}{(2i)!} \end{aligned}$$

### 6.1.8 Polya

设  $G$  是  $p$  个对象的一个置换群，用  $k$  种颜色去染这  $p$  个对象，若一种染色方案在群  $G$  的作用下变为另一种方案，则这两个方案当作是同一种方案，这样的不同染色方案数为：

$$\frac{1}{|G|} \times \sum (k^{C(f)}), f \in G$$

$C(f)$  为循环节， $|G|$  表示群的置换方法数

对于有  $n$  个位置的手镯，有  $n$  种旋转置换和  $n$  种翻转置换

对于旋转置换：

$$C(f_i) = \gcd(n, i)$$

$i$  表示一次转过  $i$  颗宝石， $i = 0$  时  $c = n$ ；

对于翻转置换：

如果  $n$  为偶数：则有  $\frac{n}{2}$  个置换  $C(f) = \frac{n}{2}$ ，有  $\frac{n}{2}$  个置换  $C(f) = \frac{n}{2} + 1$

如果  $n$  为奇数：  $C(f) = \frac{n}{2} + 1$

### 6.1.9 FWT

$$\left\{ \begin{array}{l} C_k = \sum_{i \oplus j = k} A_i * B_j \\ DWT(A)_i = \sum_j^n A_j * f_{i,j} \\ DWT(C)_i = DWT(A)_i * DWT(B)_i \\ f_{i,j} \cdot f_{i,k} = f_{i,j \oplus k} \\ f_{i,j} = [i \text{ and } j == i] \quad (and) \\ f_{i,j} = [i \text{ and } j == j] \quad (or) \\ f_{i,j} = (-1)^{[i \text{ and } j]} \quad (xor) \end{array} \right.$$

## 6.2 Geometry

### 6.2.1 The Number of Ingeter Point on a Circle

Set  $r = \text{const}$  is the radius of the circle.

$$r^2 = p_1^{a_1} + p_2^{a_2} + \cdots + p_m^{a_m} = \sum_{i=1}^m p_i^{a_i}$$

Define

$$\chi(n) = \begin{cases} 1 & n \% 4 = 1 \\ -1 & n \% 4 = 3 \\ 0 & n \% 2 = 0 \end{cases}$$

By the way,  $\chi(n)$  is a multiplicative function.

Define

$$\Gamma(p_i, a_i) = \sum_{j=0}^{a_i} \chi(p_i^j) = \begin{cases} 1 & p_i = 2 \quad || \quad (p_i \% 4 = 3 \quad \&\& \quad a_i \% 2 = 0) \\ 0 & p_i \% 4 = 3 \quad \&\& \quad a_i \% 2 = 1 \\ a_i + 1 & p_i \% 4 = 1 \end{cases}$$

Define cnt is the number of integer point on circle

$$\text{cnt}(r) = 4 \prod_{i=1}^m \sum_{j=0}^{a_i} \chi(p_i^j) = 4 \prod_{i=1}^m \Gamma(p_i, a_i) = 4 \sum_{k|r^2} \chi(k)$$

Define CNT is the number of integer point in circle

$$\text{CNT}(r) = 1 + \sum_{i=1}^{r^2} \text{cnt}(i) = 1 + \sum_{i=1}^{r^2} \left\lfloor \frac{r^2}{i} \right\rfloor \chi(i)$$

## 6.3 Josephus

### 6.3.1 $J(n, m)$

The last surviving person in n persons while per m person will be killed. (based-0,  $(m-1)\%n$  is the first be killed.  $O(m \log n)$ )

```

1 int J(int n, int k) {
2     if (n == 1) return 0;
3     if (k == 1) return n - 1;
4     if (k > n) return (J(n - 1, k) + k) % n;
5     int res = J(n - n / k, k);
6     res -= n % k;
7     if (res < 0) res += n;
8     else res += res / (k - 1);
9     return res;
10 }
```

### 6.3.2 $J(n, m, k)$

The k-th surviving person in n persons while per m person will be killed. (based-0,  $(m-1)\%n$  is the first be killed.  $O(m \log n)$ )

```
1 int J(int n, int m, int k){  
2     if (m == 1) return n - 1;  
3     for (k = k * m + m - 1; k >= n; k = k - n + (k - n) / (m - 1));  
4     return k;  
5 }
```

## 7 Others

### 7.1 Offline Algorithm

#### 7.1.1 CDQ Divide and Conquer

```

1 struct Node {

## 7.2 Randomized Algorithm

### 7.2.1 Simulated Annealing

```

1 void solve() {
2     while(T > eps) {
3         double alpha = ((rand() % 30001) / 15000.0) * pi;
4         double theta = ((rand() % 10001) / 10000.0) * pi;
5         tmp.x = cur.x + T * sin(theta) * cos(alpha);
6         tmp.y = cur.y + T * sin(theta) * sin(alpha);
7         tmp.z = cur.z + T * cos(theta);
8         tmp.dis = cal(tmp);
9         if(tmp.dis < cur.dis || (tmp.dis * 0.999 < cur.dis && (rand() & 7) == 7)) cur =
tmp;
10        //if(exp((cur.d - tmp.d) / T) > ((double)rand() / RAND_MAX)) cur = tmp;
11
12        T *= 0.999;

```

```

13     }
14 }

```

## 7.3 Other Method

### 7.3.1 Enumerate Subset

```

1  for(int i = 0; i < (1 << k); i++) {
2      for(int j = i; ; --j &= i) {
3          // work();
4          if(j == 0) break;
5      }
6  }

```

### 7.3.2 Enumerate $\lfloor \frac{n}{d} \rfloor \lfloor \frac{m}{d} \rfloor$

```

1  int cal(int n, int m) {
2      if(n > m) swap(n, m);
3      int res = 0, last;
4      for(int i = 1; i <= n; i = last + 1) {
5          last = min(n / (n / i), m / (m / i));
6          res += (n / i) * (m / i) * (sum(last) - sum(i - 1));
7      }
8      return res;
9  }

```

### 7.3.3 Find Primitive Root Modulo N

```

1  for i in range(1,mod):
2      if 3 ** i % mod == 1:
3          if i == mod - 1:
4              print("yes")
5              break
6      print("no")

```

## 8 Samples

### 8.1 vimrc

105 //multiply(BigInteger val)
106 //not() 返回其值为 (~this)
107 //shiftLeft(int n) 返回其值为 (this << n)
108 //shiftRight(int n) 返回其值为 (this >> n)
109 //toString()
110 //valueOf(long val)
111 //xor(BigInteger val) 返回其值为 (this ^ val)
112 //other
113 //Arrays.sort(array);

```

## 8.6 pb\_ds

```

1 //P.S.:无脑正确使用pb_ds代替std::set/map/priority_queue不会变慢
2 //可持久化平衡树,不过时间和空间都不太行
3 #include <ext/rope>
4 using namespace __gnu_cxx;
5 int a[1000];
6 rope<int> x;
7 rope<int> x(a,a + n);
8 rope<int> a(x);
9 x->at(10);x[10];
10 x->push_back(x) // 在末尾添加x
11 x->insert(pos,x) // 在pos插入x
12 x->erase(pos,x) // 从pos开始删除x个
13 x->replace(pos,x) // 从pos开始换成x
14 x->substr(pos,x) // 提取pos开始x个
15
16 //树
17 //不支持低级操作 (如交换左右子树)
18 #include <ext/pb_ds/assoc_container.hpp>
19 #include <ext/pb_ds/tree_policy.hpp>
20 using namespace __gnu_pbds;
21 定义一颗红黑树
22 tree<int,null_type,less<int>,rb_tree_tag,tree_order_statistics_node_update>t, other;
23 int 关键字类型
24 null_type
25 无映射(低版本g++为null_mapped_type) (无映射为类似set, 有映射类似map)

```

```

26 less<int> 从小到大排序
27 rb_tree_tag 红黑树 (splay_tree_tag)
28 tree_order_statistics_node_update 结点更新(统计子树size, 可自写), 不写不支持order_of_key
    以及find_by_order
29 插入:t.insert();
30 删除:t.erase();
31 比x小的个数:t.order_of_key(x);
32 第x+1值:t.find_by_order(x);
33 前驱:t.lower_bound();
34 后继:t.upper_bound();
35 合并:t.join(other); (other和*this值域不能相交)
36 分裂:t.split(x, other); (清空other, 将t中比x小的元素移至other)
37
38 //自定义节点更新
39 template <class Node_CIttr , class Node_Itr , class Cmp_Fn , class _Alloc >
40 struct my_node_update {
41     virtual Node_CIttr node_begin () const = 0;
42     virtual Node_CIttr node_end() const = 0;
43     typedef char metadata_type; //节点上记录的额外信息的类型
44     //以上为固定格式
45
46     //operator()的功能是将节点it的信息更新为其左右孩子的信息之和, 传入的end_it表示空节点
47     //对Node_Itr可以做的事情有: 用get_l_child, get_r_child获取左右孩子, 用两个星号获取节
    点信息, 用get_metadata获取节点额外信息
48     inline void operator()(Node_Itr it, Node_CIttr end_it) {
49         Node_Itr l = it.get_l_child(), r = it.get_r_child();
50         int left = 0, right = 0;
51         if(l != end_it) left = l.get_metadata();
52         if(r != end_it) right = r.get_metadata();
53         const_cast<metadata_type &>(it.get_metadata()) = left + right + (*it)->second;
54         //it是node_Itr, 取*后变为iterator, 再取->second变成mapped_value
55     }
56     inline int prefix_sum(int x) {
57         int ans = 0;
58         Node_CIttr it = node_begin ();
59         while(it != node_end()) {
60             Node_CIttr l = it.get_l_child(), r = it.get_r_child();
61             if(Cmp_Fn()(x, (*it)->first)) it = l;
62             else {
63                 ans += (*it)->second;
64                 if(l != node_end()) ans += l.get_metadata();
65                 it = r;
66             }
67         }
68         return ans;
69     }
70     inline int interval_sum(int l, int r) {
71         return prefix_sum(r) - prefix_sum(l - 1);
72     }
73 };
74
75 tree<int, char, less<int>, rb_tree_tag, my_node_update> T; //map
76 int main() {
77     T[2] = 'a'; T[3] = 'b'; T[4] = 1;
78     cout << (char)T.interval_sum(3, 4) << endl; //c
79     return 0;
80 }
81 //堆
82 #include <ext/pb_ds/priority_queue.hpp>
83 using namespace __gnu_pbds;
84 __gnu_pbds::priority_queue<int, std::less<int>, __gnu_pbds::pairing_heap_tag> q;

```

```

85
86 template <typename Value_Type ,
87 typename Cmp_Fn = std::less<Value_Type>,
88 typename Tag = pairing_heap_tag ,
89 typename Allocator = std::allocator<char> >
90 class priority_queue
91 Tag可以是binary_heap_tag (二叉堆) binomial_heap_tag (二项堆) rc_binomial_heap_tag
    pairing_heap_tag (配对堆) thin_heap_tag
92 用begin()和end()获取迭代器从而遍历
93 删除单个元素 void erase(point_iterator)
94 更改一个元素的值 void modify(point_iterator, const_reference)
95 合并 void join(priority_queue &other), 把other合并到*this, 并把other清空
96 push()会返回迭代器
97 五种操作: push、pop、modify、erase、join
98 • pairing_heap_tag: push和join为O(1), 其余均摊O(logn)
99 • binary_heap_tag: 只支持push和pop, 均为均摊O(logn)
100 • binomial_heap_tag: push为均摊O(1), 其余为O(logn)
101 • rc_binomial_heap_tag: push为O(1), 其余为O(logn)
102 • thin_heap_tag: push为O(1), 不支持join, 其余为O(logn); 但是如果只有increase_key, modify
    均摊O(1)
103 • 不支持不是不能用, 而是用起来很慢
104 经过实践检测得到的结论:
105 • Dijkstra算法中应用pairing_heap_tag, 速度与手写数据结构相当。
106 • binary_heap_tag在绝大多数情况下优于std::priority_queue
107 • pairing_heap_tag在绝大多数情况优于binomial_heap_tag和rc_binomial_heap_tag
108 • 只有push, pop和join操作时, binary_heap_tag速度较快
109 • 有modify操作时, 可以考虑thin_heap_tag或者pairing_heap_tag, 或手写数据结构。
110
111 //hash_table
112 #include <ext/pb_ds/assoc_container.hpp>
113 #include <ext/pb_ds/hash_policy.hpp>
114 using namespace __gnu_pbds;
115 __gnu_pbds::cc_hash_table <Key, Mapped> mp; //使用链地址法解决哈希冲突
116 __gnu_pbds::gp_hash_table <Key, Mapped> mp; //使用探测法解决哈希冲突
117 //用法和map一样

```
